Discussion Questions

Where do you think security should fit into the SDLC?

It fits in everywhere - it should be kept in mind at all stages.

Why is security more of a concern than it was 10 years ago?

There may be more people who have access in breaking into the security.

If a program has no syntax errors, can we assume that it is secure? Why or why not?

No, there can be logical errors that can lead to security issues.

Compare software security and security software.

Software security is creating good code so that there are less chances of exploitation. Security software is where there is an active prevention of leaks.
